5.000 data sets later: What INSPIRE in the cloud changes

In 2016, wetransform started to offer INSPIRE as a Cloud Service based on the hale studio and hale connect products. Now, four years later, more than 300 organisations use the various on premise, private cloud and public cloud deployments of hale connect to host more than 5.000 data sets, ranging from municipal spatial plans to national transport network data sets.

In this short presentation, the wetransform leadership team gives you a unique insight into the main struggles and lessons we've learned along the way of working with such a wide range of organisations and data sets. We will also share information on the newest INSPIRE-related features, and into our planning for 2020. After all, 2020 is the year with the official INSPIRE deadline, so we expect a lot of work to be done!
